**Hoover Landscape uses the newest technology,
state of the art fertilization and weed kill products.**

Hoover Landscape has chosen the most advanced patented fertilizer technology available to apply on its customers properties. This fertilizer developed by Monarch Scientific reduces the number of applications made to the turf, and does not leach from the soil, thus making it the most environmentally advanced technology in the industry. The patented organic nitrogen release mechanism allows soil microbes to work hand-in-hand with the turf plant root system to develop a healthier plant while utilizing other nutrients evenly throughout the season. Because the nitrogen product is released by the microbes in the soil, it can be applied as early as January and will release evenly to match the demand of the plant as soil temperatures warm, enabling us to make earlier applications in combination with pre-emergent weed control products.

The creative nitrogen product requires **30% less water** which offers better utilization of this valuable natural resource. This saving alone **reduces your cost** of maintaining a healthy beautiful turf all season long. In the fall we apply our second application of pre-emergent herbicide to prevent fall emerging weeds along with potassium and phosphate for a healthy root system, improved carbohydrates production, and to better winter hardiness for the turf.

Post emergent herbicides are applied throughout the season to prevent unwanted broadleaf weeds. We take care to chose the most environmentally sound products when treating specific weed issues that can occur throughout the season.
